Subject: Feedback Power plant self-supply and export consultation

Hello Trevor,

Part of my feedback is that Option 3 will be best as a vast majority of people have agreed.

In terms of transmission and distribution:

It needs to change, companies producing power should be required to invest in transmission improvements.

Consumers should be paying for the improvement and investing in the provinces distribution system.

I.E.

A homeowner has 30 solar panels and produces 6 kW per month of excess power. However, in the evenings the homeowner uses 1kW of power from the grid.

On the 6 kW the homeowner will be paid and a tax will be taken to pay for transmission.

On the 1kW the homeowner will pay a tax for distribution.

Let me know where else feedback is supposed to be made I was asked to join today.
